## **SIGNIFICANT CONTRIBUTIONS OF SOME OF THE PUBLICATIONS TO KNOWLEDGE**

1. In year 2002, we described for the very first time the PCV (packed cell volume) pattern of Sprague-Dawley rat in this environment. This work has far-reaching implications in that it demonstrated that PCV levels may need to be interpreted with reference to the time of sample collections.
2. In 2003, we showed clearly the relationship between testosterone, follicle-stimulating hormone and seminal parameters in Nigerian males. We also provided our local critical reference values of testosterone and follicle stimulating hormone necessary for the maintenance of normal sperm motility and concentration.
3. To the best of our knowledge, we are the first to scientifically show that *Vernonia amygdalina* and *Tapinanthus butungii* are potential anti-diabetic agents.

4. My team described the circadian rhythm of blood glucose in adult male Sprague-Dawley rats in Lagos in 2003.
5. From review of literatures available, we were also the first to clearly demonstrate that serum levels of prostate specific antigen correlate positively with serum levels of inhibin B and negatively with sperm count in Nigerian males.
6. Our work on the effects of quinine (QU) on the testis of rats and rabbits has the potential of developing a non-invasive, non-steroidal and an acceptable male contraceptive. This work is currently the most extensive study conducted by a single laboratory on the effects of QU on the cytoarchitecture and morphometry of the testes. In addition, this study has provided quantitative evidence that QU-induced testicular toxicity is largely preventable by testosterone, ascorbic acid and alpha tocopherol.
7. Our study has shown that quinine-induced testicular toxicity is an excellent animal model for the study of fertility, infertility and the process of spermatogenesis. This model has been cited by several other investigators.
